Portfolio

Experience

- Page project "Vitalidapp"

This is a project made by a team of 5 people for selfemployed doctors who seek to solve common problems in hospitals, such as errors when booking appointments or the loss of medical records, that being said, this project solves this and creates a comfortable design for the user and for the doctors themselves.
It was created using Java as back end language, html, css and javascript for front end, thymeleaf as connector between front/back and JPA for the connection between back/DB, the database is MySQL.

GitHub Repository

- News page project

This project was created by me in the learning practices during the Full Stack course and it was the first complete project that I have done, in it, it seeks to create a page that is capable of storing news and displaying them in the index once the session has started , the technologies used are Java as back end language, html and css as frontend language, thymeleaf as front/back connector, JPA as connector between back/DB and MySQL as database.
